CLAIMS

(Currently Amended) A method comprising:

servicing a Web request from a Web application;

associating a Web request Globally Unique Identifier (Web request GUID) with the Web

request, wherein events which happen during servicing of the Web request can be

identified by the Web request GUID, wherein the servicing comprises executing the

Web application that and wherein the Web application interfaces with a server that is

servicing services the Web request;

detecting the occurrence of an event in the servicing of the Web request during the

execution of the Web application, wherein a kernel trace session component of an

operating system of the server performs event buffering to detect the occurrence of the

event and traces are processed by a kernel of the operating system when the operating

system processes a part of the Web request:

logging by the server a server entry in a server trace log in response to the detecting of

the occurrence of the event in the servicing of the Web request, wherein the server

entry comprises:

information descriptive of the occurrence of the event in the servicing of the Web

request;

a server event GUID corresponding to the event; and

the Web request GUID corresponding to the Web request:

Serial No.: 10/798,819 Atty Docket No.: MS1 -1906US Atty/Agent: John C. Meline -2- lee@hayes The Business of IP*

www.ieehayes.com + 500.324.9256

logging by the Web application an application entry having an application GUID in an

application trace log, wherein each application entry is correlated with each server entry

in the server trace log by a Web request GUID, and wherein at least one of the

detecting and the logging are performed by one or more components of the operating

system of the server; and

determining which of the information that is descriptive of the occurrence of the event

to put into the server entry or application entry, or both the server entry and the

application entry, as appropriate, as a function of a predetermined level of verbosity

selected from a plurality of levels of verbosity for the Web application and server.

2. (Canceled)

3. (Previously Presented) The method as defined in Claim 1, wherein the

server entry is logged in the server trace log during the servicing of the Web request

only when the event is selected from the group consisting of:

the event pertains of the functionality of authentication;

the event pertains of the functionality of security;

the event pertains of the functionality of compression;

the event pertains of the functionality of a Common Gateway Interface (CGI); and

the event pertains of the functionality of one or more filters.

4. (Currently Amended) The method as defined in Claim 1, wherein:

the $\underline{\text{server}}$ entry is logged in the server trace log during the servicing of the Web

request only when the event pertains to a predetermined filter; and

the information comprises data going into the predetermined filter and data coming out

of the predetermined filter.

(Canceled)

(Canceled)

7. (Currently Amended) The method as defined in Claim [[6]] 1, wherein:

the server services the Web request from the Web application;

the operating system of the server comprises one or more Application Program

Interfaces (APIs);

the Web application is executed by, or interfaces with, the server;

the Web application interfaces with at least one said API to log a Web application event

as a Web application entry in the server trace log;

the Web application event occurs within the Web application itself; and

the Web application entry comprises:

information descriptive of the occurrence of the Web application event in the

servicing of the Web request by the server when the Web application is running

on, or interfacing with, the server; and

the GUID corresponding to the Web request.

Serial No.: 10/798,819 Atty Docket No.: MS1 -1906US Atty/Agent: John C. Meline -4- lee@hayes The Business of IP*

www.ieehayes.com + 500.324.9256

8. (Currently Amended) The method as defined in Claim 1, wherein [[::]] a server, having an operating system, services the Web request from the Web application; and at least one of the detecting and the logging are performed by one or more server applications that are executed by the server.

9. (Currently Amended) The method as defined in Claim 8, wherein:

the server services the Web request from the Web application;

the operating system of the server includes one or more APIs;

the Web application is executed by, or interfaces with, the server;

the Web application interfaces with at least one said API to log a Web application event

as a Web application entry in the server trace log;

the Web application event occurs within the Web application itself; and

the Web application entry comprises:

information descriptive of the occurrence of the Web application event in the servicing of the Web request by the server when the Web application is running on, or interfacing with, the server; and

the GUID corresponding to the Web request.

10. (Previously Presented) The method as defined in Claim 1, wherein filtering is performed on a URL basis, wherein each predetermined level of verbosity corresponds to a different number of data types available for use in logging application

entries and server entries, and wherein each data type corresponds to a different kind

of data that is descriptive of the particular event.

11. (Currently Amended) The method as defined in Claim 1, further comprising

generating a report comprising at least a portion of the information in each said server

entry or application entry, as appropriate, for which the Web request or server event

GUID in the server entry or application entry, as appropriate, matches a supplied ID.

wherein the amount of information in the report is a function of a predetermined level

of verbosity selected from a plurality of levels of verbosity.

12. (Currently Amended) The method as defined in Claim 11, wherein:

each said server entry and each said application entry is in a binary format; and

the generating of the report further comprises using an event GUID corresponding to

each said event to map the binary format of each said server entry or application entry,

as appropriate, into an event description that is in a format that is human readable.

13. (Currently Amended) The method as defined in Claim 1, wherein the Web

request GUID or the event GUID is the first portion of the $\underline{\text{server}}$ entry $\underline{\text{or application}}$

entry.

14. (Currently Amended) The method as defined in Claim 1, wherein the Web

request GUID is unique to the Web request with respect to other said Web requests,

and wherein and wherein .

15. (Canceled)

16. (Currently Amended) A computer-readable medium having stored thereon

computer-executable instructions for performing a method, the method , that when

executed by a processor of a computing device, cause the computing device to perform

acts comprising:

associating a Web request Globally Unique Identifier (Web request GUID) with a Web

request, wherein events which happen during servicing of the Web request can be

identified by the Web request GUID, wherein the servicing comprises executing a Web

application that interfaces with a server having an operating system and that is

servicing the Web request;

servicing the Web request with a server from a Web application that is executing on the

server, wherein during the servicing multiple logger streams are simultaneously active

to log the events as the Web request is being serviced by the server;

detecting the occurrence of the events during the servicing of the Web request by the

server, wherein a kernel trace session component of an operating system of the server

performs event buffering to detect the occurrence of each event and traces are

Serial No.: 10/798,819 Atty Docket No.: MS1 -1906US Atty/Agent: John C. Meline

-7- lee@hayes The Business of IP*

www.leehoyes.com + 500.324.9256

processed by a kernel of the operating system when the operating system processes a

part of each Web request;

logging by the server each of the events as server entries in a server trace log, wherein

at least one of the detecting and the logging are performed by one or more

components of the operating system of the server, and wherein each server entry

comprises:

information descriptive of the occurrence of an event;

an event GUID corresponding to the event; and

the Web request GUID corresponding to the Web request;

logging by the Web application an application entry having an application GUID in an

application trace log, wherein each application entry is correlated with each server entry

in the server trace log by a Web request GUID; and

determining which of the descriptive information to put into the server entry or

application entry, or both the server entry and the application entry, as appropriate, as

a function of a predetermined level of verbosity selected from a plurality of levels of

verbosity for the Web application and server.

17. (Canceled)

18. (**Previously Presented**) The computer-readable medium as defined in Claim

16, wherein the entry is logged in the server trace log during the servicing of the Web

request by the server only when the event is selected from the group consisting of:

the event occurs within the context of a predetermined URL; the event pertains of the functionality of authentication; the event pertains of the functionality of security; the event pertains of the functionality of compression; the event pertains of the functionality of a CGI; and the event pertains of the functionality of one or more filters.

- 19. (Previously Presented) The computer-readable medium as defined in Claim
 16, wherein the entry is logged in the server trace log during the servicing of the Web
 request by the server only when the event pertains to a predetermined filter, wherein
 the information comprises data going into the predetermined filter and data coming out
 of the predetermined filter.
- 20. (Previously Presented) The computer-readable medium as defined in Claim 16, wherein the method further comprises at least one of: activating the logging when the logging is deactivated; and deactivating the logging when the logging is activated.
- **21. (Original)** The computer-readable medium as defined in Claim 20, wherein the activating and the deactivating are performed remotely from the server.

22. (Previously Presented) The computer-readable medium as defined in Claim

20, wherein the server trace log is in a remote location from the server.

23. (Original) The computer-readable medium as defined in Claim 16, wherein at

least one of the detecting and the logging are performed by one or more components

of an operating system of the server.

24. (Previously Presented) The computer-readable medium as defined in Claim

23, wherein:

the operating system of the server comprises one or more APIs; and

the Web application interfaces with at least one said API for the logging of each said

Web application event as an entry in the server trace log.

25. (Canceled)

26. (Previously Presented) The computer-readable medium as defined in Claim

16, wherein:

the operating system of the server comprises one or more APIs; and

the Web application interfaces with at least one said API for the logging of each said

Web application event as an entry in the application trace log.

Serial No.: 10/798,819 Atty Docket No.: MS1 -1906US Atty/Agent: John C. Meline -10- lee@hayes The Business of IP*

www.leehayes.com + 500.324.0256

- 27. (Previously Presented) The computer-readable medium as defined in Claim 16, wherein the step of logging of the entry in the server trace log is in response to the detecting of the occurrence of the event in the servicing of the Web request.
- **28. (Previously Presented)** The computer-readable medium as defined in Claim 16, where the method further comprises generating a report containing at least a portion of the information in each said entry for which the Web request GUID in the entry matches a supplied ID.
- 29. (Previously Presented) The computer-readable medium as defined in Claim28. wherein:

each said entry is in a binary format; and

the generating of the report further comprises using the event GUID to map the binary format of each said entry into an event description that is in a format that is human readable.

- 30. (Previously Presented) The computer-readable medium as defined in Claim16, wherein the Web request GUID is the first portion of the entry.
- **31. (Previously Presented)** The computer-readable medium as defined in Claim 16, wherein the Web request GUID is unique to the Web request with respect to other

said Web requests, and wherein the Web request is for at least one of: a static file; a

Common Gateway Interface (CGI); and an active server page (ASP).

32. (Currently Amended) A system having a processor for tracing a Web

request on a network, the system comprising:

identifying means for identifying when a predetermined event occurs in a

predetermined Web request when the predetermined Web request is being serviced,

wherein a kernel trace session component of an operating system of the system

performs event buffering to detect the occurrence of the event and traces are

processed by a kernel of the operating system when the operating system services a

part of the Web request; [[and]]

a logging means, in communication with the identifying means, for logging the event in

a server trace log as the event happens, wherein the log of the event in the server

trace log comprises:

a GUID corresponding to the predetermined Web request; and

information descriptive of the occurrence of the event when the predetermined

Web request is being serviced, wherein the logging means is further for

determining which of the information that is descriptive of the occurrence of the

event to put into the server entry in the server trace log as a function of a

predetermined level of verbosity, wherein the level of verbosity is selected from a

plurality of verbosity levels;

Serial No.: 10/798,819 Atty Docket No.: MS1 -1906US Atty/Agent: John C. Meline

-12- lee@hayes The Business of IP*

www.ieehayes.com + 500.324.9256

a second logging means, in communication with the identifying means, for logging the

event in an application trace log after the event happens, wherein the logging of the

event in the application trace log comprises:

a GUID corresponding to the predetermined Web request; and

information descriptive of the occurrence of the event when the predetermined

Web request is being serviced, wherein the second logging means is further for

determining which of the information to put into the application entry as a

function of a predetermined level of verbosity, wherein the level is selected from

a plurality of verbosity levels; and

a correlation means for correlating each application entry with each server entry in the

server trace log by a Web request GUID.

33. (Currently Amended) A network environment comprising a server having a

processor<u>, an operating system</u> and multiple simultaneously active logger streams that

are concurrently running on the server and that are each trace-enabled, the server

servicing Web requests from a Web application while performing Web request-based

tracing to produce traces in a server trace log that comprise a Web request GUID for

each Web request and to flow each Web request GUID from the server across to the

Web application, wherein the Web application produces traces in a Web application

trace log, wherein the traces in the server trace log and the Web application trace log

comprise information that is descriptive of events which occur during the servicing of

the Web request by the server and the Web application, wherein the information in the

Serial No.: 10/798,819 Atty Docket No.: MS1 -1906US Atty/Agent: John C. Meline -13- lee@hayes The Business of IP*

www.leebayes.com + 500.324.9256

traces is determined in part as a function of a predetermined level of verbosity, wherein

the level is selected from a plurality of levels of verbosity for the server and the Web

application, [[and]] wherein the Web application can correlates each event in the Web

application trace log with a server GUID from the server by a Web request GUID, and

wherein a kernel trace session component of the operating system of the server

performs event buffering to detect the occurrence of the events and traces are

processed by a kernel of the operating system when the operating system processes a

part of each Web request.

34. (Canceled)

35. (Previously Presented) The network environment as defined in Claim 33,

wherein the server returns each said trace from the multiple logger streams to a

corresponding said trace-enabled Web application for which the Web request was

serviced by the server.

36. (Currently Amended) A server module operating on a server, the server

module comprising:

logic stored in a memory configured to service a Web request from a Web application

operating on the server;

logic configured to detect an occurrence of an event in the servicing of the Web

request; and

Serial No.: 10/798,819 Atty Docket No.: MS1 -1906US Atty/Agent: John C. Meline

-14- lee@haves The Business of IP*

www.leehoyes.com + 500.324.0256

logic configured to log a server entry in a server trace log, wherein the <u>server</u> entry

comprises:

information descriptive of the occurrence of the event of the servicing of the

Web request; and

a Web request Globally Unique Identifier (Web request GUID) corresponding to

the Web request, wherein the Web request GUID is associated with the Web

request, so that events which happen during servicing of the Web request can be

identified by the Web request GUID which is logged with each of the events;

logic configured to log an application entry in an application trace log, wherein the

application entry comprises:

information descriptive of the occurrence of the event of the servicing of the

Web request; and

a Web request GUID corresponding to the Web request; and

logic configured to determine which of the information descriptive of the occurrence of

the event to put into the server entry, the application entry, or both the server entry

and the application entry, as a function of a predetermined level of verbosity, wherein

the verbosity is determined by selecting one of a plurality of discrete indices, the indices

corresponding to human-readable labels, wherein the descriptive information of the

event comprises an event GUID and human readable text, and wherein event GUIDs

may be correlated with Web request GUIDs.

(Canceled)

Serial No.: 10/798,819 Atty Docket No.: MS1 -1906US Atty/Agent: John C. Meline

-15- lee@hayes The Business of IP*

www.leehayes.com + 500.324.0256

38. (**Currently Amended**) The server module as defined in Claim 36, further comprising logic configured to limit the entries in the <u>server</u> trace log that correspond to a predetermined said event that is selected from the group consisting of: the event occurs within the context of a predetermined URL; the event pertains of the functionality of authentication; the event pertains of the functionality of security;

the event pertains of the functionality of compression; the event pertains of the functionality of a CGI; and

the event pertains of the functionality of one or more filters.

39. (Currently Amended) The server module as defined in Claim 36, wherein: the entry is logged in the <u>server</u> trace log during the servicing of the Web request only when the event pertains to a predetermined filter; and the information includes data going into the predetermined filter and data coming out of the predetermined filter.

40. (Canceled)

Serial No.: 10/798,819 Atty Docket No.: MS1 -1906US Atty/Agent: John C. Meline
